### 4 Innovations in glass transport

Italcarelli has recently introduced two innovative side loader trucks in its production range. These are the EN4L 45, a side-loader for the transport of packed glass and the EN4L 150, for the transport of Jumbo sheets. According to the Italian company, the special tongs of the EN4L 45

enables the operator to load and unload cases of glass quickly and in complete safety. It is also able to transport three cases of glass at a time as well as loading the same cases into the truck.

The EN4L150, on the other hand,

is a revolutionary loader for the transport of Jumbo glass sheets. It can transport up to 15,000kg of glass at a time and, thanks to its telescopic forks and special pantograph clamps, says Italcarelli, enables the operator to move the load with extreme ease and speed.

Both these machines have independent steering wheels, controlled by PLC, that enable transport in any direction. Moreover, all the machines are equipped with special optical and ultra-sound

sensors that facilitate loading and unloading operations of the glass sheets and protect their integrity against accidental breakages.

In order to simplify control systems, new touch-screens with graphical interface have been introduced, thus facilitating the settings of the operator using the trucks.
