52 Multidirectional loaders with further innovations

Italcarrelli has recently made some important improvements to its range of side-loaders, in particular to the *EN4L 150*.

The EN4L 150 multidirectional loader, with capacity of 15 tonnes of jumbo glass, was, says Italcarrelli, already innovative in its previous format thanks to commands by means of touch screen as well as ultra-sound sensors positioned on the forks that enable the automatic lining up of the loader with the glass.

One of these improvements is, without doubt, the use of CAN-BUS system that has simplified even more the electrical circuits of the loader, also facilitating maintenance operations.

Moreover, thanks to the application of a modem, Italcarrelli's technicians can, says the company, change settings and carry out auto-diagnostics of the loader in a few minutes, without going personally to the factory where the loader is being used.

Another important improvement is the possibility to hydraulically adjust the inter-axis of the telescopic forks, which facilitates greatly the loading operations of the glass. With the new hydraulic positioner, operations become easier since the operator can change the width by means of simple keys on the control panel, thus saving time.

Last but not least, a glass package counter system has been installed to speed up the pick-up phases of the glass but, above all, increase safety conditions.

With this system the operator only has to input the number of packages to be taken on the touch screen and the forks adjust themselves automatically.

All these improvements, says Italcarrelli, are made possible thanks to continuous investments in research, in order to supply its clients with products that can satisfy to the utmost all the needs of the end users.
