

Compact side loaders for fast and safe glass transport

EN4L 30 is the new side-loader that Italtcarrelli has just put on the market and that is part of the wide range of machines that the company proposes for the movement and transport of flat glass.

The EN4L 30 loader has all the innovative functionalities of the EN4L range but with a loading capacity of three tons.

The choice to limit the loading capacity is due to continuous requests from Middle and Far East countries for economically priced machinery. Moreover, with this kind of loading capacity, Italtcarrelli technicians have been able to design a machine with very compact dimensions able to move around in very small places.

The driver's position, in the upper part of the loader, enables the operator to have optimal vision during both the loading and movement phases.

Moreover, the system

to adjust the height of the driver's position enables the loading and unloading of glass from trucks without having to remove the canopy.

EN4L 30 is suitable for the picking up of packs of glass from the stacker to the end of the float line. It also enables the movement of glass in wooden boxes.

Like all other Italtcarrelli products, this loader also includes solutions such as a touch screen and ultra-sound sensors which simplify the use of the loader and make the transport of the glass faster and completely safe.
