

Facilitated glass transport

Italcarrelli has introduced a new version of the *EN4L 60*, multi directional side-loader for the transport of glass sheets. As per the previous version, the new *EN4L 60* has a maximum load capacity of 6,000kg and, therefore, says Italian **Italcarrelli**, enables to transport up to three cases of glass at a time.

The *EN4L 60* has been equipped with telescopic forks that enable a

simpler pick-up of the glass compared to the previous version with double frame. Thanks to the introduction of telescopic forks, it is possible to equip the machine with optical and ultra-sound sensors which, says **Italcarrelli**, enable the self aligning of the loader with the glass and the automatic adjustment of the forks as per the number of cases of glass to be loaded.

According to the company, it is also possible to install a hydraulic forks positioner so that the operator can adjust from the control position the width between the forks as per the type of glass to be transported.

The control panel is, as with all **Italcarrelli** machines, made up of a joystick and touch screen to simplify the set-up of

the loader and avoid possible wrong movements.

Last but not least, the high sweep of the loader also enables

the loading of glass directly in the centre of trucks without the need for overhead cranes.

All these improvements, says **Italcarrelli**, have considerably simplified glass transport operations, while increasing safety and decreasing execution times.
