Jumbo-sized glass loaders

Italcarrrelli has recently introduced to the market its new version of *PTN330* loaders for the transport of jumbo-sized glass sheets on racks. These machines have been designed with an innovative system of access to the control cabin by means of large steps that enable the operator to go up and down a lot faster and with less effort. This innovative design conforms to the accident prevention and safety in the workplace norms. Despite this change in access, the machine maintains its compact size and dimensions, which, together with its agility and manoeuvrability, enables it to move easily in the smallest areas.

Other than the driver's position, there are also some other systems to make glass transport safer, such as, the blocking system of the glass-positioning clamps. This solution enables the movement of the glass sheets only if they are held still by the clamps. If the load has not been blocked, it will not be possible to transport the glass. This and other devices enable operators to use these loaders in complete safety in each and every situation.

Last, but not least, the position of the commands on the driver's panel has

also been looked into so as to make its use easier and more comfortable for the operators. As with previous models, it is always possible to change the position of the driver from the right to left hand side and vice versa, so as to guarantee the highest visibility in each and every situation.
